REFLECTIONS

ON THE

COW-POX,

ILLUSTRATED

BY CASES TO PROVE IT AN ABSOLUTE SECURITY

AGAINST THE

SMALL POX;

ADDRESSED TO THE PUBLIC,

IN A

LETTER TO DR. JENNER,

FROM

WILLIAM FERMOR, ESQ.

Segnius irritant Animos demissa per Aurem, Quam quæ sunt oculis Subjecta sidelibus.

HORACE.

OXFORD:

PRINTED BY DAWSON AND CO.

AND SOLD BY COOKE, HANWELL, AND PARKER;

SOLD ALSO, IN LONDON, BY ROESON, IN NEW BOND STREET;

AND MESSRS. ROBINSON, PATERNOSTER ROW.

1800.

DEAR SIR,

I Know no one to whom I can address a letter on the subject of the Cow-pox so properly as to yourself; to whose labours the public is so much indebted for the great and important discovery of its use and application. Ever since I was so fortunate as to be introduced to you at Cheltenham, some time ago, I have frequently revolved in my mind your very interesting conversation on the subject; and, I can truly say, from that period I have never lost sight of it.

The disease has been long known to dairy farmers in different parts of the kingdom, and particularly to many in my neighbourhood; but who could ever have imagined that this very serious complaint, as it is well known

to be by those who have been affected with it in its original state, could ever have been employed to soften down, and one may say annihilate one of the most loathsome and alarming disorders, which afflict the human race; I mean the Small-pox?

Great merit, I think, is due to those who first suggested a remedy against the virulence of the latter, and introduced inoculation for it; and we are particularly indebted to the re_ spectable family of the Suttons, who quitting the ordinary path of practitioners, ventured to recommend and purfue the cool regimen. Many eminent Professors of Medicine in this country, had for many years past been convinced of its propriety, but had not resolution to quit the trammels of the schools, and relinquish habits, which education and prejudice unfortunately had rendered facred. Amongst the rest, occurs the name of our illustrious Sydenham, who was fo convinced of the propriety of the cool regimen, and who felt so fensibly the opposition he met with from the practitioners of his own time, that he thus pathetically exclaims, "However it is " I have used this method for my own chil"dren, my dearest and nearest relations, and all others that have committed themselves to my care; and if I am to be blamed for 66 any thing, it is because I have sometimes yielded to those of a contrary opinion, lest I should be counted morose; and for the confirmation of this, I appeal to my intimate acquaintance. And this is another 66 unhappiness, that sometimes also, when 66 the standers by have contemned all I have proposed through the whole course of the 44 disease, yet they have charged me with the 66 death of the patient, though he was de-66 66 stroyed by that heat which the friends and nurses promoted, and which I so much inveighed against; upon which account, by " reason of the insuperable prejudice of most " people, I have thought it well for me, if I " were never called again to any that have the Small-pox." 66

It is well known to all medical professors, that notwithstanding the above decided opinion of this great man, the same absurd practice was uninteruptedly pursued, even to our own times. How many, indeed, are there now living who not only remember, but have

perhaps experienced, from the obstinacy of nurses, and the ill-judged fondness of parents, the same warm treatment in that disease, which not only added to its constitutional violence, but considerably increased its contagious effects.

We are fortunate, however, in these latter times, to be able to verify the prophetic exclamation, of the above great physician, -"This is, indeed, the true method of curing "this fort of Small-pox, and which will " prevail when I am dead, notwithstanding the " great prejudices men have taken against it " by reason of an erroneous opinion." Though the original virulence of this dreadful malady and its fatal effects have of late years been confiderably diminished by the modern practice of inoculation, it does not appear that its contagious influence has been much abated; on the contrary, its universality has certainly been much extended. It has compelled every individual to submit to inoculation, notwithstanding constitutional habits and family complaints, may have rendered its good effects precarious. Nay, how few parents are there who have not had many anxious moments on account of the refult, notwithstanding they have employed the most eminent in the profession and the coolest mode of treatment.

How necessary it is likewise to chuse a sequestered spot for its communication, detached from places inhabited by the commonalty, who from prejudice, or disinclination, resuse to avail themselves of the salubrious effects of this important discovery! What an expence has the government of the country incurred by inoculating the army alone, and how have the military contributed to spread the disease, by communicating it to the inhabitants of the places they passed through, as well as to those amongst whom they afterwards resided.

What an absence from duty was necessary for the soldier, during its progress, and what a diminution of bodily strength, even under its most savourable appearances! What considerable danger frequently arose from the intemperance and misconduct of the patient; and how many lives were often lost by their fatal consequences!

Let us now review the nature of the Cow-

pox, and its effects. The diforder requires no previous or subsequent regimen. No infection attends it; the complaint is in general merely local; and no absence from ordinary employments, nor is any medicine necessary. In a national and civil light, what an important difcovery! Let us next confider, is it a preservative against the Small-pox contagion? We are happy to know that men of the first eminence at this time, not only in our own island, but in many other parts of the world, have decidedly proved it to be fo. Dr. Woodville, an eminent practitioner, and who is now phyfician to the Small-pox and Inoculating Hofpital at Pancras, concludes an ingenious pamphlet on the effects of the Cow and Smallpox, in the following remarkable words: -"It has been afferted, that persons have had "the Small-pox after having been affected " with the Cow-pox; and fome facts have " been published with a view to shew that " instances of this kind have actually happened. But all these, as far as I have seen, " have been very defective in not affording " fufficient proof that the affection supposed to " have been the Cow-pox, was in reality that " disease. On the other hand, the instances " which have been brought forward to prove " that those who had undergone the genuine " Cow-pox, refisted the infection of the Small-" pox, are unquestionably decisive, and sufficiently numerous to establish the fact in the most satisfactory manner. This circumstance then appears to be as much a general law of the fystem, as that a person having had the Small-pox is thereby ren-" dered unsusceptible of receiving the disease a fecond time. For of all the patients " whom I inoculated with variolous matter, " after they had passed through the Cow-pox, " amounting to upwards of 400, none were " affected with the Small-pox; and it may " be remarked, that nearly a fourth part of "this number was fo flightly affected with " the Cow-pox, that it neither produced any " perceptible indisposition or pustules."

To this very respectable authority I will add the opinions on this subject of Dr. Pearson, an eminent London Physician. He says, in his statement of the progress in the vaccine inoculation—" Concerning the important "point of the certainty of the action of the "Cow-pox on the human constitution to pro" duce unfusceptibility of taking subsequently " the Small-pox, I can only fay at prefent, that I have inoculated many scores with Small-pox matter after the vaccine disease, and never with the effect of exciting the Small-pox; though I have had accounts fent to me, not of people taking the Smallpox after the inoculated Cow-pox, but of these taking the Small-pox after the Cowpox in the casual way. I have, indeed been defired to see even some of my own patients, who I was acquainted had taken the Small-" pox after the Cow-pox; but these cases turned out to be either those in which the Cow-pox had not in reality preceded, or "they were cases of merely local affection " from the inoculated Small-pox. With re-" spect to the facts of other practitioners, I " shall, at a future time, make some remarks " on them to render their accounts confistent " with those of Dr. Jenner, Dr. Woodville, and myself. In the mean time, I will not allow that any person's evidence is on this " point much to be depended upon, unless " he really knows what are the characters of "the Cow-pox puftule, and what are those " of the variolous, and some other common

"eruptions. From the preceding general refults, without entering into a more particular account, I think we may fafely conclude that the Cow-pox inoculation is attended with advantages fufficient to force its way speedily into general practice, and that, in course it will supercede, and ultimately extinguish, the Small-pox; but this conclusion is only made, provided no new facts shall arise, adverse to the experience now possessed."

With respect to foreign correspondents, he adds—" The sensation excited on the Conti"nent by the vaccine inoculation has been
"much more considerable than even in our
"own island; as I learned first from Dr.
"Marcet, and since, by a letter from Peschier.
"At Vienna, Dr. Ferro inoculated two of his
"own children with vaccine matter, which
"I transmitted; and next, Dr. de Carro in"oculated two of his own children. An ac"curate journal of these two last cases was
"kept by Dr. de Carro, which he has had
"the complaisance to communicate to me
"through the hands of Dr. Peschier. The
"above patients had the vaccine disease in

" the usual mild way that they have had it in England, and were inoculated subse" quently for the Small-pox, but without taking that disease."

Your own very valuable differtations upon this complaint, and of its preventive powers against the contagion of the Small-pox, ought to be fufficient, I apprehend, to convince every one that the Cow-pox and Smallpox are fynonymous terms. But fo fuspicious are men in general of the prejudices, which may arise in the most candid and enlightened mind in favour of any important discoveries made by the publisher of them, that we are afraid in general to take almost any thing upon trust, but what comes through the medium of others, who may appear to us to be less prejudiced, or less interested therein; and where the well-being and often the life of man are feriously concerned, no precaution in reality can be too great.

For this reason, when I first seriously entered upon this enquiry, I was determined to form my opinion ultimately on experiment alone. How much I have reason now to be convinced

of the truth of what I had read and heard, the candid reader by a perusal of the annexed cases and statements must determine.

With respect to the origin of this disorder let the learned dispute. I think it of little or no consequence to the public. The causes of bodily complaints in general, are very little known; particularly of cutaneous ones. Who has ever yet discovered from what source either the Chicken or Swine-pox arises?— Sydenham fays with regard to the Small-pox, " I ingenuously acknowledge that by reason " of a defect in the understanding which is " common to me and the rest of mankind, I " know not the effence of this difease." And I think the inhabitants of the Banks of the Nile would be much to blame, were they not to avail themselves of the fertilizing qualities of its waters, because perhaps they are ignorant of the fources from whence they flow. Your own opinion appears to be, "that it originates " in the ichorous discharge from some local " difease of a horse; generally from greasy heels," which from my own enquiries, I have good reason to believe. Many, I know, dissent from this opinion; but no one I think has yet

produced any arguments to disprove it. Some laugh at the, idea, and think that the translation of a humour from the heels of a horse to the teats of a cow, must naturally produce a ludicrous complaint, which can have no analogy with the Small-pox; and that the catalogue of disorders, which afflict the human race is sufficient, without having recourse to the brute creation for more.

But let us no longer dispute about causes, let us look principally to effects. Our great philosopher Dr. Franklin, in a treatise on electricity, fays, on a fimilar occasion, "Nor " is it of much importance to us to know the " manner in which Nature executes her laws. "It is enough if we know the laws them-" felves." Would it not be abfurd in us to forego the wonderful and falutary relief produced by electricity in many diforders our bodily frame is subject to, because we cannot in a fatisfactory manner explain what the electrical fluid is, or from whence it arises? A variety of medicines are fold by empyrics in this country, whose effects are wonderfully advantageous in many of our complaints. An eminent physician in my neighbourhood, who is now no more, used wisely to say upon that subject, What signifies their composition, if their effects answer our expectations? A philosopher in his chamber may be much amused by theoretic discussions upon causes, from the pen of an ingenious writer, but we ought to be always upon our guard against any fuch discussions in matters of consequence, which are not subsequently verified by experiment. This idea, I think, is strongly confirmed by the opinion of Dr. Franklin, who in one of his papers on philosophical subjects, when writing to a friend, fays, with his usual candour, "I own I have too strong a penchant " to the building of hypothesis; they indulge " my natural indolence. I wish I had more " of your patience and accuracy in making " observations, on which alone true philosophy " can be founded."

How long has the world been amused with the relations of the wonderful effects of animal magnetism, and what sums of money have been expended by individuals to be initiated into its mysteries! The unfortunate Louis the XVIth having heard very extraordinary reports of the success of the great professor of

it, Mr. Mesmer, then residing at Paris, desired Dr. Franklin, at that time Minister from the United States to his court, with two of his own physicians, to examine the merits of it. They attended Mr. Mesmer through all his operations, and returned the following expressive though laconic answer to his Majesty:—
"That where there was no cause, there could be no effect."

Though I was much pleased with your own decided opinion and that of many able practitioners of the present time, that the genuine Cow-pox is a certain preservative against the contagion of the Small-pox; yet, as I said above, I was determined to ascertain the fact; and you will perceive that the Small-pox matter has been ineffectually communicated to more than one half of our patients, who had been previously inoculated with the genuine Cow-pox, and recovered from that complaint.

I say the genuine, for without that necessary precaution, practitioners may be led into the greatest errors, from whence the most alarming consequences may ensue. One may as well pronounce, that individuals who have

had the Swine or the Chicken-pox, are fecure from the variolous infection, as to suppose that a person who has undergone the spurious Cow-pox, is not afterwards subject to the Small-pox contagion.

You have accurately described in two of your publications, in what the genuine and spurious disorder consists; which I shall here insert for the information of my readers.-"The true disease appears on the nipples of " the cows in form of irregular pustules. At " their first appearance they are commonly " of a palish blue, or rather of a colour " fomewhat approaching to livid, and are " furrounded by an eryfipelatous inflammation. These pustules, unless a timely remedy be applied, frequently degenerate into phagedenic ulcèrs, which prove extremely troublesome. The animals become indifposed, and the secretion of milk is much leffened. Inflamed fpots now begin to " appear on different parts of the hands of "the domestics employed in milking, and " fometimes on the wrifts, which quickly " run on to suppuration, first assuming the " appearance of the small vesications produced

" by a burn. Most commonly they appear " about the joints of the fingers and at their " extremities; but whatever parts are af-" fected, if the fituation will admit, these " superficial suppurations put on a circular " form, with their edges more elevated than "their centre, and of a colour distantly ap-" proaching to blue. Absorption takes place, " and tumours appear in each axilla. The fystem becomes affected. The pulse is " quickened; and shiverings, with general laffitude and pains about the loins and limbs, with vomiting, come on. The head " is painful, and the patient is now and then " even affected with delirium. These symp-" toms, varying in their degrees of violence, " generally continue from one day to three " or four, leaving ulcerated fores about the " hands, which, from the fensibility of the " parts, are very troublesome, and commonly " heal flowly, frequently becoming phage-" denic, like those from whence they sprung. " Lips, nostrils, eye-lids, and other parts of " the body, are sometimes affected with sores, " but these evidently arise from their being " needlefly rubbed or fcratched with the " patient's infected fingers. No eruptions

on the skin have followed the decline of the feverish symptoms in any instance that

" has come under my inspection, one only

" excepted, and in this case a very few ap-

" peared on the arms; they were very minute,

" of a vivid red colour, and foon died away

" without advancing to maturation; fo that I

" cannot determine whether they had any

" connection with the preceding symptoms."

With regard to the spurious fort, you say,

Ist. "That arising from pustules on the "nipples or udder of the cow, which pus-

" tules contain no specific virus.

2dly. "From matter, (although originally possessing the specific virus) which has suf-

" fered a decomposition, either from putre-

" faction or from any other cause less obvious

" to the fenses.

3dly. "From matter taken from an ulcer in an advanced stage, which ulcer arose from a true Cow-pock.

4thly. "From matter produced on the human skin from contact with some peculiar morbid matter generated by a horse."

You add in another place, "The most perfect criterion by which the judgment may be guided, is perhaps that adopted by those who attend insected cattle. These white blisters on the nipples, they say, never eat into the sleshy parts like those which are commonly of a bluish cast, and which constitute the true Cow-pox, but that they affect the skin only, quickly end in scabs, and are not nearly so insectious."

Many have afferted, that the Cow-pox is no fafeguard against the contagion of the Small-pox; and many respectable names appear in publications to fanction this opinion. That the spurious Cow-pox affords no security against it, I readily grant. Nor will the Swine or Chicken-pox previously received, prevent the Small-pox contagion. That the genuine Cow-pox is a certain prefervative against the Small-pox, I flatter myself, the following cases will sufficiently prove. They are felected from many I could bring of perfons, who having previously had the Cowpox, have never been able to receive the infection of the virus from the Small-pox, though inferted a confiderable time after, and at different periods. These cases are well known to practitioners and inoculators in this neighbourhood, and I have received most of them from the parties themselves.

FIRST CASE.

Jeoffry Tredwell, a reputable farmer, and a tenant of mine, about fourteen years ago had the Cow-pox in the farm he then occupied, at Chesterton, in this neighbourhood. His brother, William Tredwell, being employed constantly in milking the cows, was infected with the Cow-pox, and had the difeafe feverely in his hands and fingers. Jeoffry not being engaged fo much in milking as his brother, did not receive the infection. About three years after, these two brothers were inoculated with variolous matter, by Mr. Lister, of Charlbury, an eminent practitioner, at a house appropriated for that purpose. William Tredwell, who had undergone the. Cow-pox, could not receive the infection, though he was inoculated feveral times, and remained in the house with the other patients. Jeoffry, who had not been infected with it, had a very full Small-pox eruption.

SECOND CASE.

Alban Collingridge had the Cow-pox about five or fix and twenty years ago, at his father's farm, at Poodle, which affected his fingers in a violent degree. About four years after, he was three times inoculated for the Smallpox, by Mr. Lifter, without effect. Two of his brothers, who had never had the Cowpox, received the variolous infection. He flept with them in order to take it, but no confequence enfued. He has frequently fince been exposed to its contagion, and has very lately inoculated his children with the Smallpox, without being in any shape infected with it himself.

THIRD CASE.

Mr. Stevens, a reputable farmer of East Claydon, in the county of Bucks, had the Cow-pox on his farm, in the year 1764.—He himself was insected with it by milking the cows. About four years after, he was inoculated with variolous matter, but without effect. About the year 1791 his family were inoculated with the rest of the parish

for the Small-pox, with which they were all infected, but he was not, though he attended them the whole time. This case must appear decisive with regard to the security the Cowpox matter affords against the variolous infection, as there was a space of twenty-seven years between his having received the disorder from his cows, and his attending his family in the inoculated Small-pox; and an interval of four years between the time he had the Cow-pox, and his being himself inoculated with the Small-pox without effect,

FOURTH CASE.

Jane Grey, of St. Aldate's, in the Univerfity of Oxford, and now wife to one of the
fervants at Corpus Christi College, received
the infection of the Cow-pox by milking at
a farm, at Bletchington, in that county, about
twenty-five years ago. Eight or nine years
after that period, she nursed and slept with
one of her children, who had the Small-pox
in the natural way; but no ill consequences
ensued. She has since had the Small-pox
twice in her family, and was each time sully

exposed to the contagious effluvia, but resisted its infection. This person was never inoculated for the Small-pox, and was much astonished to find that she could not receive it by contagion; for at this time she was totally ignorant of the preventive powers of the Cow-pox.

FIFTH CASE.

Thomas Slatter, now butler to Sir Digby Mackworth, Baronet, in Oxford, had the Cow-pox when he was eighteen years of age, in consequence of milking infected cows.-At the age of twenty-four he went to the Inoculating Hospital, at Pancras, to be inoculated for the Small-pox. The variolous matter was inferted twice, at the interval of a fortnight between each time, without effect. About fixteen years after, he attended his own children during inoculation, without receiving any infection. He is now thoroughly convinced that he is secure from all danger of catching it, though he is equally certain that he has never had any complaint of the fort except the Cow-pox.

SIXTH CASE.

Mr. Henry Collingridge, of Godington, a reputable farmer, and a tenant of mine, received the Cow-pox infection by milking, when he was fourteen or fifteen years of age. Ten years after, he was three times inoculated for the Small-pox, without effect. After an interval of ten years more, he inoculated two of his children at his own house; and again, after a lapse of several years, he inoculated another child. But though fully and frequently exposed to the contagion, he was not in any degree affected by it.

SEVENTH CASE.

The following circumstances will serve to prove that the infection of the Small-pox, previously received, prevents the contagion of the Cow-pox:—

Mr. Hill, a considerable farmer, of North Aston, in the county of Oxford, had the Cow-pox in his farm, in the year 1796.—Having a large dairy, many of his cows were infected with it. The disorder was commu-

nicated univerfally to the fervants who were employed in milking. Mr. Hill's three fons conftantly milked with the rest during the time, but neither of them were in any shape affected with it. They had all three been previously inoculated with the Small-pox.

EIGHTH CASE.

Mr. Charles Collingridge, of Somerton, in this neighbourhood, who has fuccessfully inoculated between two and three hundred with the Cow-pox, lately inoculated five patients who had previously had the Small-pox; two of them in the natural way, and three by inoculation. He, at the same time, and from the same arm, inoculated ten others with the Cow-pox, nine of whom received the infection. The arms of the five who had had the Small pox appeared at first rather inflamed, but the inflammation on the punctured part soon subsided, and left no marks of infection.

I apprehend, that the most prejudiced and sceptical reader must allow from a perusal of the above cases, that the genuine Cow-pox is

a certain prefervative against the Small-pox, though inserted at very distant periods.

But as my object, during the course of this enquiry, has been principally to produce facts that come within my own knowledge, instead of arguments and proofs, however irrefistible, that have come from others; in consequence of various experiments lately made under my own eyes, I am now justly entitled to call your's a truly valuable discovery; I mean the inoculation of the Cow-pox in order to prevent the contagious effects of the Small-pox. But not being a professional man, and consequently not equal to pursue this investigation with full fatisfaction to myself; and having besides many country avocations, I found it necessary to apply to some one, who was competent to the undertaking. To yourfelf, in particular, upon this occasion, I feel myself much indebted, for having recommended to me your nephew, the Rev. Mr. Jenner, to whose medical knowledge and skill in the treatment of this disorder, I owe principally the fuccess of my experiments. For he not only took the trouble of inoculating all our patients with the Cow-pox, but likewise of

I was determined to have the matter from its true fource, I mean from yourfelf, he was fo good as to bring it with him from Berkeley to my house.

I am happy likewise, upon this occasion, to be able to say, that my experiments have been made with the most liberal concurrence, and under the inspection of many of the most respectable and learned professors of the University of Oxford, and the most noted practitioners of its environs, whose names will appear in the annexed account; and who, from motives of humanity, and principles truly patriotic, have been so kind as to give up much of their time and attention to this very interesting subject.

Amongst the rest, I feel myself particularly indebted to Dr. Wall, of distinguished professional abilities, and Clinical Professor in that University; to Sir Christopher Pegge, the Public Reader in Anatomy there; to Dr. Williams, the Regius Professor of Botany; who have not only encouraged me in this undertaking, but have been witnesses of its

salubrious effects. I feel myself likewise under particular obligations to Mr. Grosvenor, a very eminent furgeon there; who has been fo kind as to inoculate fome of our patients afterwards with variolous matter, and to give up much of his time to the inspection of them after their inoculation. I am happy in having this opportunity of acknowledging likewife my obligations to Meffrs. Davis, furgeons of eminence at Bicester; to Mr. Braine, surgeon, of the same place; to Mr. Olley, of known professional skill, at Brackley; and to Mr. Watfon, furgeon, at Aynho; who have been fo good as to inoculate, with variolous matter, the patients Mr. Jenner had previously inoculated here with the Cow-pox.

During the course of these experiments, upon so considerable a number of different subjects of all ages, from eleven days to seventy-sive years, no pustule appeared on any of them, but on the inoculated part, except in two instances; a single pustule on the forehead of one, and one upon the arm of another. No sickness of any consequence ensued, nor any loss of time from ordinary avocations. The disorder was not communicated by con-

tagion to any who refused to submit to its inoculation. The symptoms which generally occurred, were, a pain in the axilla, or in the head, sometimes in both; but no nausea, or one may say, any other constitutional illness. Indeed, some of them were entirely free from all the above complaints. An efflorescence generally appeared about the punctured part, and sometimes extended, though without pain, down the fore-arm, and up to the shoulder. But this happened very seldom. No medicine of any fort was administered, nor had any of them any inflammation on their arms, that could create any uneasiness.

NAMES OF PERSONS

WHO WERE

INOCULATED WITH THE COW-POX.

Those that have an Asterisk before them have fince been inoculated with variolous matter, by different professional men in the neighbourhood.

With Cow-pox in all	326
With Small-pox afterwards	173

I must now strongly recommend to practitioners, to be well affured by ocular evidence. that their inoculated patients have received the Cow-pox infection. As the fluid is of a much milder nature than the variolous, it will often be necessary to infert it more than once. I have frequently feen it applied three or four times, and in fome habits even then without effect. I once faw it inferted fix times, but no infection was produced. If particular attention be not paid to this circumftance, patients may lull themselves into an ill-grounded fecurity of being for ever proof against the Small-pox contagion, whereas in reality they have never had the Cow-pox. I have in consequence, struck off many names from our original list of such as were inoculated here, because we never had an opportunity of seeing them again. Some lived too far off, and others were perhaps too indolent to return. I have, however, good reason to believe, that every individual in the printed list of names, received the Cow-pox; and, as a proof, many were afterwards indifcriminately inoculated with variolous matter, though they never in any shape felt its influence.

A farmer in my neighbourhood, who pretended to be an inoculator for the Cow-pox, inoculated two of Mr. Jenner's patients, who had never received the Cow-pox from him, and who were returning to be inoculated a fecond time. He likewise failed in his attempt to give them the Cow-pox. In confequence, they afterwards received the variolous infection, which was communicated to them inadvertently, on their affertions of having had the disorder. Fortunately for the inhabitants of the village, a confiderable part of them had been inoculated by Mr. Jenner, with the vaccine complaint. They confequently refisted the variolous contagion. Five children belonging to one of these men, had previously received the Cow-pox infection, and had likewise been inoculated with variolous matter, without effect. They lived under the fame roof with the father during the whole time of his being under the influence of the Small-pox, and one flept in the fame bed with him. They were at the same time again inoculated from him with variolous matter, but still remained proof against all contagion.

On account of the difficulty of communicating the vaccine infection, which frequently requires to be inferted, as I said above, more than once, it is much to be wished that the practice were to be confined to professional men only. Such as have other avocations and employments, which require their particular attention, cannot possibly give up so much of their time, as feems to be required, to this very important business. Some, to my knowledge, in different parts of the kingdom, have received the variolous infection, after having been ineffectually inoculated with the Cowpox, and not feen a fecond time by those who inoculated them. Whereas the medical practitioner, who has no other employment, would in the course of his rounds, call upon such, to inspect their arms, and examine the progress of the disorder, and again repeat the inoculation, if necessary.

I am likewise well aware, that there are many respectable medical names affixed to cases, wherein it seemed to appear, that individuals had received the variolous contagion, after having had the vaccine disorder. That they had undergone the spurious fort, I grant;

as it is well known to be no fafe-guard against the former complaint.

Being well convinced that every liberal mind will be ready to acknowledge an error they may have fallen into, from not having been aware at the time of publishing their opinions, that there were a genuine and a spurious sort, I cannot recommend to them a better example for their imitation, than that of our great and candid Sydenham; who having by experience found, that he had discovered a better method of treating the gout, with which he himself was much afflicted, than the one he had formerly practised, retracts his first opinion, in the sollowing remarkable words from Virgil:—

Pinxit, vanum etiam mendacemque improba finget.

It is unnecessary for me to say any more on this truly interesting subject. I leave the impartial reader to his natural reslections; but I think, in consequence of the above premises, I may venture to say, that he will now be of opinion that the genuine Cow-pox is mild in its effects, congenial with every situation and em-

ployment of life, totally void of contagion, and a certain prefervative against the baneful influence of the Small-pox. That no constitutional or family complaint can interfere with its effects, or prevent its adoption.

To conclude; though the public have certainly great obligations to many diffinguished modern practitioners, for having, by the cool regimen and present mode of treatment, considerably abated the natural virulence of the Small-pox, to you alone we are certainly indebted for its complete annihilation.

I remain, dear Sir,

With true regard,

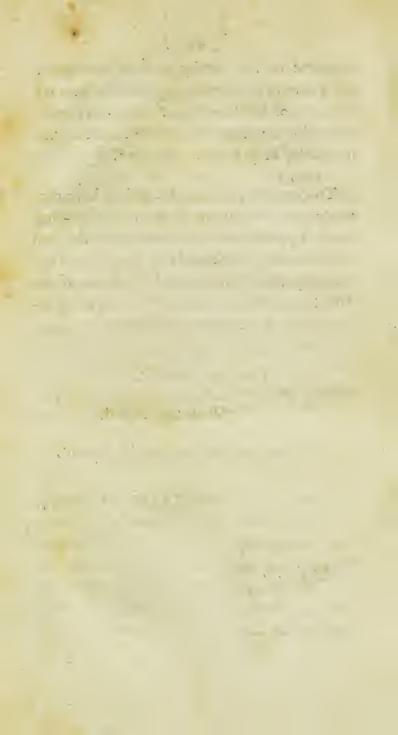

Your very obedient humble servant,

WILLIAM FERMOR.

TUSMORE,

May the 27th, 1800.
